

CaseWhy Admin — How-To Guide

2026-09-20 · @Someone

What `/admin` is, and who can see it

Everything under `/admin/*` on `app.casewhy.com` is Peter-only (or whoever else is added to the `isAdminEmail` allowlist in the code) — a signed-in user who isn't on that list never sees an **Admin** link and gets redirected if they type an admin URL directly. Nothing here is reachable by a regular CaseWhy user.

To get there: sign in at `app.casewhy.com` with an admin account, and click **Admin** in the top navigation (it only appears for admin accounts) — or go straight to `app.casewhy.com/admin`.

This guide describes every admin function as of round 119 (Sep 20, 2026). Two things to know about how current it is: (1) it was written from the task specs that built each page, not from clicking through the live site — round 120 asks Code to build a matching in-app version of this guide directly from the live navigation code, which is the more reliable source going forward; (2) admin pages get added or changed often as CaseWhy grows, so treat this as a snapshot, and check the in-app How-To page (once round 120 ships) or ask Cloud for anything that seems out of date.

A note on how this is organized: every admin page belongs to a **group**, and the groups are what you'll see as sections in the sidebar once you're signed in. This guide follows that same grouping.

The admin home page and navigation shell

`/admin` itself is an index page: a card for every admin function, grouped the same way the sidebar is, each card showing a short description and a badge if anything on that page needs attention (a pending count — items waiting for approval, unread alias mail, and so on).

Every admin page shares the same shell: a sidebar on desktop (a tab strip on mobile) listing every group and page, the current page highlighted; a breadcrumb at the top of each page ("Dashboard › Admin › Marketing › Log", for example) that you can click through at any point; and a permanent link back to the main CaseWhy dashboard, so admin never feels like a separate app.

1. Sign in and click **Admin**, or go to `app.casewhy.com/admin`.
2. You land on the index — scan the cards for anything with a pending badge; that's usually the thing to check first.
3. Click a card, or use the sidebar, to open any page. The breadcrumb and sidebar are always there to get back or move to something else — you never have to use the browser's back button.
4. Once round 120 ships, a banner at the top of this index links to an in-app How-To page that mirrors this guide, built directly from the live list of admin pages.

Marketing group

This is the group you'll use daily — it's where every social post, blog post and email issue an AI agent drafts sits until you approve it.

Queue — `/admin/marketing`

The single approval queue for everything content-related: drafted social posts (Reddit, X, Threads, Facebook, Pinterest, etc.), blog posts waiting to publish, and email issues. Each item shows its **full** content — the whole post or rendered email, not a one-line summary — so you can judge it without opening anything else.

1. Open the Queue from the sidebar or the `/admin` index.
2. Read the full content of each pending item.
3. Choose an action: **Mark posted (as-is)** or **Mark posted (edited)** for anything you post yourself by hand (Reddit, Facebook groups, forums); **Approve** to let it auto-post on channels that post themselves (X/Threads, the blog, email); **Reject**; or **Acknowledge / dismiss** for informational items.
4. Anything flagged **escalated** (a sensitive or unusual case) needs your own judgment before you act — don't approve on autopilot.

Log — `/admin/marketing/log`

A history of everything that's actually gone out, per channel, with counts — useful for a quick "what did we post this week" check, and it can export to CSV. Reached from a link on the Queue page, or the sidebar.

Attribution — `/admin/marketing/attribution`

Read-only traffic numbers: which channel and which specific post or link is actually sending people to casewhy.com, using UTM tracking. Check this weekly rather than daily — it's a trend view, not a queue.

Settings — `/admin/marketing/settings`

The knobs behind the automated posting: the subreddit list it watches (add or remove one), the daily cap on how many drafts get generated, and whether product links are turned on sitewide (`links_enabled`) — that last one is shown read-only, since it's meant to flip on once, after USCIS production approval, not be toggled casually.

Mail group

Covers every casewhy.com email alias (privacy@, security@, legal@, help@, and the rest) and how they're monitored.

Replies — `/admin/inbox`

Drafted replies to incoming alias mail, waiting for your approval before anything sends. Nothing here goes out on its own — that's a hard rule, not a setting.

1. Open Replies.
2. Read the incoming message and the drafted reply together.
3. Approve, edit-then-approve, or reject. On approval, the reply sends from the correct alias address automatically.
4. `security@` and `legal@` items always alert you immediately rather than sitting quietly in the queue — treat those first.

Alias config — `/admin/aliases`

How often each alias is checked, and whether it can draft a reply for you to send directly or must always stage for review. Once round 119 ships, this will be superseded by the fuller **Ops** console below — check there first if it's live.

Outreach group

Backlink drafts — </admin/backlink-outreach>

Drafted outreach emails asking partner sites (legal-aid orgs, schools, directories) to link back to CaseWhy — part of the free-SEO link-building effort. Review the draft, edit if you want to add your own voice, and send it yourself from your own email; this page doesn't send anything automatically.

Content group

Updates — </admin/updates>

Every blog post that exists (on the </updates> page), whether it's published, still pending, or edited from its original draft — with a status chip for each and a link to preview or edit it.

1. Open Updates and find the post you want.
2. **Preview** opens it exactly as it will look live, before anyone else can see it.
3. **Edit** opens a simple text editor (Markdown, with a live preview alongside) — change the title, summary, sources, or body, then **Save**. Saving does not publish; it just updates the draft.
4. To actually publish, go back to the Marketing **Queue** and approve the post from there — that's the one action that makes it public.
5. If you ever want to undo your edits and go back to the original text, use **Revert to repo file** on the edit page.

Editing after a post is already live is allowed — useful for fixing a typo — but the page warns you first, since saving then publishes the change immediately.

Search

A read-only report of what people actually type into CaseWhy's site-wide search (the ⌘K overlay), including which queries return nothing useful, over the last 30 days. Worth a monthly glance — a recurring zero-result query is a sign a page or FAQ entry is missing.

Ops console — `/admin/ops` (round 119, awaiting build)

This page doesn't exist yet as of this guide's writing (round 119 was just filed for Code) — covered here so it's ready to use the day it ships. It brings the alias and social-channel controls into one settings page, as standing configuration rather than something you set once in code:

Email aliases table — one row per alias, with: how often it's checked (default nightly, faster for `security@` / `legal@`), whether it responds directly or stages for review, a Start/Stop toggle, when it was last checked, and how many items are pending (linking to **Replies** above).

Social channels table — one row per channel (X, Threads, Facebook, Pinterest, Reddit, etc.), with: check/post frequency, Auto-post vs. Stage-for-review, Start/Stop, pending count (linking to the **Queue**), and an **Add channel** button for onboarding a new one — note that adding a row here doesn't build the actual posting code for a brand-new channel; Code still has to add that separately, and the page will say so.

Once it's live, treat this as the one place to change *how* the automation behaves — you shouldn't need a code change or a request to Code just to slow down a channel or pause an alias.

Keeping this guide current, and what's not covered yet

A few things worth knowing:

- **This was written from task specs, not a live click-through.** Cloud couldn't reach `app.casewhy.com` from its own sandbox to verify labels and pages directly, so treat page names and exact steps as "as designed," not "as confirmed live today." Round 120 (filed alongside this document) asks Code to build a matching How-To page inside `/admin` itself, generated from the real, current navigation code — once that ships, it becomes the source of truth and this document should be corrected against it.
- **Not covered here:** the self-enrollment application forms (`/attorneys/join`, `/legal-aid/join`, `/dso/join`, and similar) notify you by email today rather than through a dedicated admin review page — if that's changed or you'd like a proper review queue for those, it's worth a future round.

- **New admin pages:** round 98 set a standing rule that every new `/admin/*` page registers itself in one shared list (so it always shows up in the sidebar and the index) — which also means round 120's in-app guide, once built, updates itself automatically as new pages are added, without anyone having to remember to update a document by hand.
